Danil Barantsov

Machine Learning Engineer | Data Scientist
Moscow | dbaranczov@inbox.ru | Telegram: @baranczov | GitHub: baranczov

Education

Central University, Moscow 2024 – 2028
Bachelor's in Mathematics and Computer Science, Artificial Intelligence track

- GPA: 8.67/10
- TBank and Arenadata scholarship recipient

HSE University, Moscow 2024 – 2028
Bachelor's in Mathematics and Computer Science

- Admitted to the joint bachelor's program of Central University and HSE's Faculty of Computer Science, Applied Mathematics and Informatics

Work Experience

Machine Learning Engineer November 2024 – March 2026
VkusVill

- **ML pipeline development.** Designed the architecture of the intelligent core for an on-call support incident analysis system based on a hybrid ML pipeline. Combined speech recognition, transcript processing and report generation into a sequential workflow for processing calls.
- **Speech recognition.** Integrated Vosk for local, real-time transcription of call audio streams. Implemented low-latency CPU processing so that conversation text entered the system as an incident was being discussed.
- **Report generation.** Implemented a use-case layer to buffer transcripts and group them by session. Integrated the Groq API with Llama-3 70B to generate reports from call transcripts at more than 200 tokens per second.

Machine Learning Engineer February 2026 – July 2026
IT-ONE

- **Text data preparation.** Prepared a dataset of 60,000 requests across 12 categories for support ticket routing. Cleaned text, removed duplicates and agreed on annotation guidelines. Created time-based train/validation/test splits, keeping entire request threads within a single split.
- **NLP model development.** Fine-tuned RuBERT using PyTorch and Hugging Face Transformers and compared it with a TF-IDF and logistic regression baseline. Achieved a macro-F1 of 0.86 versus 0.78 for the baseline on a held-out dataset. Analyzed errors and class imbalance and proposed annotation refinements for ambiguous categories.
- **Service preparation for integration.** Implemented a Dockerized FastAPI service with batch processing, request validation, error logging and model versioning. Measured p95 latency of 120 ms on an NVIDIA T4 test system for single requests of up to 256 tokens. Handed the service and API contract over to the backend team; production deployment did not take place during my tenure.

Machine Learning Engineer March 2026 – October 2026
TBank

- **ML infrastructure migration.** Independently upgraded the MLOps framework, GitLab CI, Python and Airflow for 25 compliance models: 25 training DAGs and 25 QA DAGs across train/QA/prod environments. Migrated models from S3 to Model Registry. The changes were deployed to production, simplifying model loading, versioning, retraining and maintenance.
- **Migration verification.** Retrospectively tested the old and new versions of all 25 models on an existing dataset, confirming that prediction scores and aggregate metrics matched within the specified tolerance.
- **172T model development.** Prepared the training dataset from a unified sampling base, correcting SQL scripts and Airflow DAGs. Personally implemented and tested changes for 10 hypotheses, improving ROC-AUC from 0.92 to 0.95 in experiments. The improved version had not been deployed to production when I left.
- **ML system documentation.** Updated ML System Doc for 25 models, checking data preparation, training and inference descriptions against the code. The changes were accepted by the entire team.

Achievements

- Winner, regional stage of the All-Russian Olympiad for School Students in Mathematics
- Winner, All-Siberian Open Olympiad for School Students
- 3rd place, Datathon 2.0 (TBank case competition)

Projects

Loan Prepayment Prediction Kaggle | GitHub

- Performed EDA and preprocessing on more than 500,000 observations, accounting for temporal shifts between datasets; analyzed distributions by month and product.
- Built a CatBoost and LightGBM ensemble with optimized weights, achieving a ROC-AUC of 0.74 against a baseline of 0.73707.

Alfa-Bank Customer Churn Prediction GitHub

- Performed EDA and feature engineering on data from 125,000 customers; identified a 3–12 month period with churn rates of up to 18%.
- Built a CatBoost model with a ROC-AUC of 0.9012; used SHAP to identify churn drivers, defined five risk segments and prepared customer retention recommendations.

Steam Game Review Prediction Kaggle | GitHub

- Developed a PyTorch neural network to predict positive and negative review counts, combining numerical features, platform flags and TF-IDF representations of game descriptions.
- Achieved an MAE of approximately 180 and ranked 21st out of 242 participants in the Kaggle competition.

Weather Forecast Web Application GitHub

- Developed a web service for viewing weather forecasts along a route on a map.
- Implemented the client-server architecture, external API integration, request handling and weather data visualization.

Personal Assistant with AI Agents GitHub

- Developing a personal assistant with a team to manage tasks, finances, health and wardrobe.
- The project includes a React and TypeScript interface and a trend discovery service built with Node.js and Fastify, featuring web search, SQLite memory and LLM integration via OpenRouter or Ollama.

Party Bot: Telegram Mini App for Events GitHub

- Developed an application for ticket sales and student event management, including electronic tickets, an auction, promo codes, a merchandise shop and a token system with QR codes.
- Built a React and TypeScript interface, a FastAPI backend with PostgreSQL, and integrations with Telegram and Google Sheets.

Technical Skills

Classic ML: Python, NumPy, Pandas, scikit-learn, CatBoost, LightGBM, Optuna, data analysis, data preprocessing, feature engineering, model ensembles, cross-validation, SHAP.
MLOps: Docker, Git, GitLab CI/CD, Apache Airflow, Spark/PySpark, Hive, HDFS, S3, Model Registry, Linux, training and inference automation, ML pipeline testing, model monitoring.
Frontend: HTML, CSS, JavaScript, TypeScript, React, responsive layouts, REST API, data visualization, npm, Vite.
Backend: Python, Flask, FastAPI, SQL, PostgreSQL, ClickHouse, Kafka, REST API, client-server architecture, external service integration, testing, Docker.
Deep Learning: Python, PyTorch, neural networks, NLP, embeddings, transformers, LLMs, multimodal models, GPU training, speech recognition.
Mathematics: Linear algebra, calculus, probability theory, mathematical statistics, discrete mathematics, optimization methods, hypothesis testing, A/B testing.
Languages: Russian (native), English (B2).
